PROFILE

5 years of **Java** software engineering experience and specialized in developing and managing complex projects. Led core projects, delivering high-quality results. Strong experience in code review, cross-team development, mentoring, requirements gathering, ensuring compliance with accessibility, and efficient project delivery in an agile environment using Scrum practices.

SKILLS

Backend:	Java, Python, C++, Go, Rust, Node.js
Frameworks:	Spring Boot, Spring Cloud, Redis, Kafka, Hibernate
Databases:	SQL(Oracle DBMS, MySQL, PostgreSQL), NoSQL(MongoDB)
Cloud & Dev-ops:	AWS (S3, Lambda, RDS, SNS, SQS, App Runner, etc.), Docker, Kubernetes, Jenkins, GitHub Actions
Testing & Tools:	JUnit, Cypress, Playwright, Gatling, Postman, Linux

EXPERIENCE

Therap Services LLC | Software Engineer II

Remote, USA | March 2021 - Present

- Developed and maintained a large-scale B2B enterprise SaaS application(therapservices.net) with 40,000+ CCU(Concurrent Users), and 1,000,000+ active users
- Optimized the most frequent cron-jobs and reduced DB QPS for high traffic features by leveraging Oracle coherence, query optimization, and intelligent indexing, achieving **25x** more throughput and **20%** reduction in latency
- Dockerized multiple services, including the authentication server, and developed a single-click deployment tool, streamlining DEV and QA deployment, cutting deployment time by **50%**, and reducing developer hardware requirements by **33%**
- Steadfastly managed the **JDK 8 to JDK 21** upgrade of the Therap application, managed in-app and service dependencies, leveraging OpenRewrite and custom recipes for efficient execution
- Developed data-feed and dashboard for high-traffic, high-volume data, processing over **1 million records per day** using Spring Batch, JDBC Template, Redis with **asynchronous processing, multithreading, and caching** for data-driven decision-making, reporting, and compliance monitoring, enabling real-time insights
- Integrated **Salesforce and MaestroQA APIs** into the Therap system to enable real-time synchronization of client data, automated QA reporting, and performance analytics, streamlining customer support workflows and reducing manual intervention by up to **80%**
- Load tested API endpoints with Gatling, identified a bottleneck in the legacy UUID generator, and replaced it with Twitter's **Snowflake** UUID, achieving 5x insert/update operations per second
- Contributed to implementing in-house authentication module using Spring Security featuring MFA, OAuth2, JWT, Role-based Access control, IP whitelisting, rate-limiting, CAPTCHA, etc, replacing third-party IDPs and **reducing authentication-related operational costs to zero**
- Re-architected Excel/CSV data import pipelines with queued and batch processing, achieving **100x** faster response and **20x** increase in throughput on large(**150k+** record) imports
- Migrated core legacy messaging infrastructure from ActiveMQ to Apache Kafka, introduced a phased migration strategy with a custom synchronization bridge ensuring zero message loss (outbox pattern), resulting in **70%** throughput gain and **40%** latency reduction
- Optimized on-demand loading of resources across the system, cached static resources, and integrated CDNs, reducing network bandwidth by **20%** and improving page load time with overall responsiveness
- Worked on HIPAA-compliant healthcare projects handling PHI data. Delivered state-specific solutions for Kentucky and Tennessee, implemented rollup-dashboard, and contributed to meeting the 21st Century Cures Act mandated by the Federal Government of the USA, which helped Therap to secure multi-million dollar state contracts

Tech stack: Java, Python3, Hibernate, Spring MVC, Spring Boot, React, JavaScript, RESTful API, Oracle DBMS, Oracle Coherence, Tomcat, Weblogic, Docker, Apache Kafka, Jenkins

EDUCATION

Bangladesh University of Engineering and Technology (BUET)

B.Sc. in Computer Science and Engineering

Dhaka, Bangladesh

February 2016 - February 2021

PROJECTS / OPEN-SOURCE

Beiong | E-commerce platform

- Architected and implemented the core microservice infrastructure featuring API Gateway, load balancing, service discovery, rate limiting, and centralized configuration management using Spring Boot and Spring Cloud
 - Developed multiple domain-driven microservices from scratch, including user, product, order, and cart modules, ensuring scalability, modularity, and seamless inter-service communication
 - Designed and developed a standalone Attachment Microservice enabling secure, direct-to-**S3** uploads via pre-signed URLs, automated post-upload processing with **AWS Lambda** and **SNS**, and real-time status updates, resulting in a scalable, event-driven file handling system with zero backend upload load
 - Automated end-to-end and unit testing using JUnit and Cypress, reducing manual testing efforts, and performed load and stress testing with Gatling and Postman to ensure system reliability and performance
- Tech-stack:** JDK21, Spring Boot, Spring Cloud, Hibernate, Postgres, Next js, RESTful APIs, Protobuf, Docker, AWS

Jumghor | Github

An Experimental privacy-centric social media application. Developed the basic features, like User registration, User Add and delete contact, Posts, Comments, etc.

Tech-stack: Java 21, Node.js, Spring Boot, Spring Cloud, Spring Security, Eureka, Open Feign, WebSocket, Kafka, Zookeeper, PostgreSQL, React, Tailwind CSS, Microservices, Restful APIs, Docker

HONORS & AWARDS

- BDMO (Bangladesh Mathematical Olympiad) district champion for primary and secondary divisions
- IUT 2017 Hackathon Top 10
- Solved 800+ problems on different CP platforms
- Perfect Attendance Certificate, Notre Dame College

LANGUAGE

- English: IELTS(7/9)
- Bengali: Native
